CERMET

Of uniform structure and composition, CERMET is composed of titanium carbide (TiC) and titanium nitrade (TiN) with a super-alloy metal binder. CERMET has a low friction coefficient which eliminates built up edge and improves surface finish. Its high resistance to thermal deformation and its low conductivity make higher cutting speeds possible and result in lower flank wear and edge cratering. Its high degree of hardness and toughness, with resistance to oxidation, extend tool life.

PCT20:

- Of TiCN alloy, good red hardness, high wear resistance, and good oxidation resistance.

Physical Properties:

- Hardness: 91.8/92.5
- Strength: 1700ISO
- Grade: K05/K10/M10/P05/P15
- Typical Applications: Suitable for finishing and semi-finishing of low-alloy steels and stainless steels.

Ceramic Inserts

ISO 9001

Application Data

Use the strongest shape and largest nose radius possible. Round and square inserts should be used whenever possible since they are stronger than diamonds and triangles. For heavier cuts, 5/16" thick inserts are recommended. Use the largest lead angle possible. Use the largest side cutting edge that the shape of the workpiece allows. As the side cutting angle is increased, the length of the cutting edge that contracts the workpiece is increased and the load is distributed over a greater area of the cutting edge. Use proper edge preparation techniques. Proper edge factors in successfully applying ceramics over a wide range of materials and applications.

PCA-2 is Hot Pressed Black Ceramic

Roughing and finishing of hardened steel and chilled cast irons, and for machining cast irons with sandcast scale. Also clean irons or steel of hardness below 425 BHP or about rockwell C-45.

PCH-1 is Hydrostatic Pressed White Ceramic

Used for roughing and finishing of cast irons, carbon and alloy steel, ferritic and martensitic stainless steels, and annealed tool and die steels. Inserts demand a rigid setup in machining operations and are not suited to milling or machining very hard iron or steel.

High Pressure Disconnecting Pliers

To disconnect the hydraulic coolant hose, follow two safe and easy steps:

1. Plase the thinner section of the wrench-nose between the coolant hose and the connector
2. Close the wrench and it will disconnect notch 1 of the coolant hose. Use the thicker section of the wrench-nose and close again to disconnect notch 2.

ALLIED MACHINE & ENGINEERING CORP Criterion TFX & CFX Boring Bars

Steel Shank

- Designed to accept either a flat top or a chip-controlled insert
- These bars are equally effective for internal bores as well as OD turning.
- The offset head permits an easy disposal of chips and a more than adequate coolant flow
- Features ground shank diameter for use in round holders and four flats for use on a flat surface — such as a turret-post holder
- When held in a round holder their 3-point contact assures solid clamping and maximum holding power and the set screw flats place the cutting edge on the exact centerline of the bar

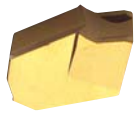
D-GRIP KGTN/R/L Cut-Off and Grooving Inserts

The cutting forces help lock the insert firmly into place and increase the grip on the insert. Removal is possible by using a tool at the back of the insert. The unique chip breaker design of the insert shapes the chips which are narrower than the slot. The system has a cut-off capacity up to 23" diameter.
KGTN neutral, KGTL left hand, KGTR right hand



Notes on Selecting Insert Size

- Use 8° to reduce burr size
- Use KGTN 0° for flatness of surface, chip flow, large depth to width of cut ratio and high feed rate
- Use 0° and 8° for tubing

Lead angle: standard and neutral 0°, right 8°
See below for carbide grade selection chart

Carbide Grade Selection

For steel cutting
DC340 (C5) recommended for machining steel, austenitic stainless steel, machining to center, and interrupted cuts.
DC740 (C5-C6) TiC+TiCN+TiN coating, recommended for interrupted cuts, machining of steel, austenitic and martensitic stainless steel and pipes.

For cast iron and non-ferrous materials
DC210 (C2-C3) recommended for cast iron, non ferrous materials and plastics.

NIKCOLE MINI-SYSTEMS™ Grooving and Cut-Off Inserts (GIE-7-GP)

Nikcole Mini-Systems™ is the only system that provides two cutting edges in one insert in extremely narrow widths. This system also features a full range of toolholders with minimum hardware...only one positive locking insert screw and the unique insert pocket design assures a repeatable cutting edge location.
Standard inserts are stocked in widths from .019" to .078" in uncoated and coated carbide grades.
The Mini-System™ is a unique method of producing narrow grooves and providing an economical means of cut-off...all in a wide variety of materials.
For grooving and cut-off under .078" width.

Carbide Grade Application
C2 - Uncoated grade recommended for cast iron and non-ferrous materials.
C5-PV - Coated grade recommended for machining steels, cutting solid bars to the center and for interrupted cuts.
C6-PV - Coated grade recommended for machining steels, cutting off and grooving at higher speeds.

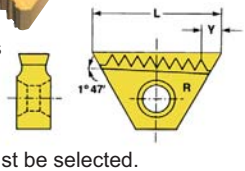
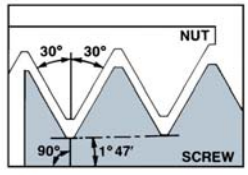
VARGUS USA External & Internal Inserts

ISO 9002

American NPT

- For CNC machining centers and milling machines
- Work for making a thread on a non-rotatable bulky part
- Higher machine speeds
- Multi-tooth type inserts
- Less downtime and tooling changes
- Less machine power required
- Better thread surface finish yields better sealing and engagement
- No undercut is necessary due to CNC control accuracy





NOTE: milling inserts can be used either right hand or left hand. However, appropriate holder must be selected. Right hand is standard, left hand is available on request.

Basic Features:

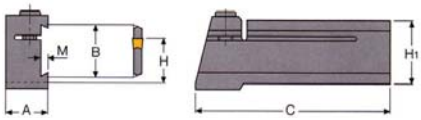
- Wedge clamping
- Prism on top and bottom secures central alignment of insert in seat
- Molded chipformer produces curled and narrowed chip for free flow and undamaged surface
- Large variety of machining applications
- Parting off and grooving
- Face grooving—trepanning, slot milling
- Cutting force enhances grip

F-W Cutoff Tool System

The lastest enhancement combines the System-W geometry with its double chipformer that excels in the machining of stainless steels and exotics, and the System-F concept, which features a redesign of the insert locking mechanism for greater stability and consistency. The result, System F-W, is available in the most critical sizes for those tough applications. If you have problems with inserts splitting while cutting or just need to do your cutoff application faster, try our System-F and System F-W cutoff tools. The following pages contain the components for the F-Cut and T-Cut System.

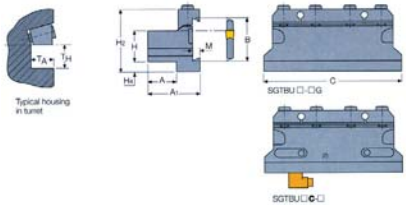
SGTBR/L

R-Right hand
L-Left hand
SINGLE-ENDED: Used in universal turning machines. Equipped for center height adjustment of cutting edge.



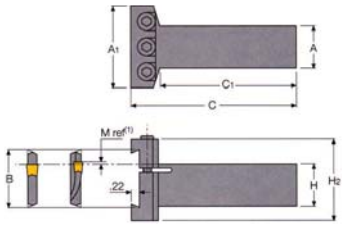
SGTBU-G

REMOVABLE TOP CLAMP: Used in CNC turning center. Specially for machines where the tool stations require lateral access to the tool holder screws.



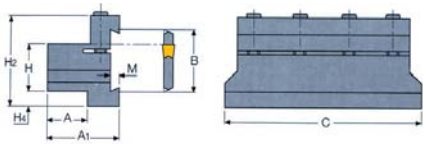
SGTBF

SQUARE SHANK PERPENDICULAR TO BLADE ADAPTER: Used mainly for face grooving. Also for cut-off and grooving on tool stations parallel to machine spindle.



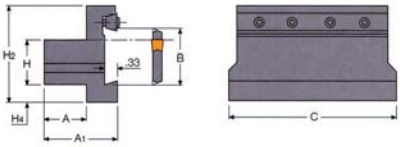
SGTBN

INTEGRAL FLEXIBLE CLAMPING: Applies for right and left hand turning. Cutting-edge height equals shank height. Used on CNC and universal turning machines.



SGTBK

HEAVY DUTY APPLICATIONS: Wedge clamp strengthens hold on blades.
Best for large widths of cut and high loads.



UBHCR/L

R-Right hand
L-Left hand
UNIVERSAL TOOL BLOCK: To be mounted on CNC machine turrets. Using half and full length self-grip blades with a separate short clamp, holder block and blades are clamped separately.

F-CUT: Fixed location of cutting edge provides repeated accuracy of depth of cut for:
- Pre-cutoff position
- Grooving
- Post-cutoff position
- Accuracy of center height of cutting edge
- Stopper ensures repeatability
- Stopper limits load on jaws
- Flush top for unobstructed chipflow

NOTE: F-CUT and T-CUT inserts are not inter-changeable with F-CUT and T-CUT blades.

- High rigidity and high stability
- Superior straightness of cut

F-CUT: Fixed location of cutting edge provides repeated accuracy of depth of cut for:
Pre-cutoff position
- Grooving
- Post-cutoff position
- Accuracy of center height of cutting edge
- Stopper ensures repeatability
- Stopper limits load on jaws
- Flush top for unobstructed chipflow

W-Type: Central ridge and double cavities. Most efficient on stainless steel and most types of steel at moderate feed rates.

J-Type: Positive rake and sharp curved cutting edge. For smooth chip flow and better surface quality at low feeds down to .0012 ipr. For stainless steel, steel and soft materials.

A-Type: Positive rake cavity and shoulders. For cutting ductile metals like aluminum and copper.

Width of Cut (WOC) and depth of Cut (DOC)
In selecting WOC, the main factor to consider is the required DOC. The ratio DOC above 8x WOC is of practical use on alloy steel of average machinability: for example, applying a .118" WOC insert GFN-3 to cut-off a 1.890" solid bar.

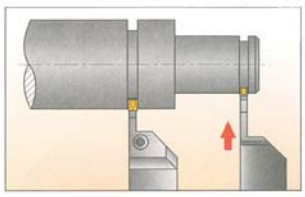
Additional factors which affect DOC capacity, relative to the ratio, are:

Lead Angle
A neutral insert with 0° lead angle increases DOC capacity.

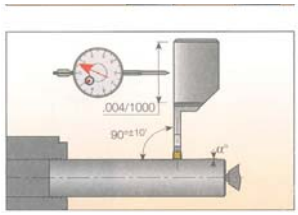
Holder or Blade Size
To minimize risk of vibration and deflection always choose:

- Blade or toolholder with smallest possible overhang
- Toolholder with maximum shank dimension
- Blade height (B) dimension which is larger than Tmax
- Blade or holder with maximum blade width (largest possible insert seat size.)

Example:
A WOC .374" on blade
SGFH 53-9 (B=2.07") extends the ratio of DOC to WOC by some 50% to 4.724".



Insert Support
A self-grip tool is recommended for deep radial machining. A screw-clamp holder is recommended for axial and small DOC machining.



90° Mounting
It is very important that the insert is mounted at 90° to the center line of the workpiece in order to obtain perpendicular surfaces and reduce the risk of vibration.

GRIP SYSTEM Groove-Turn

Multifunction Operations

The Groove-Turn tools are multifunction tools, able to operate in a sequence of grooving and turning modes. Moving from turning to grooving requires consideration of the basic Grip principle, thereby eliminating the possibility of insert breakage. In this situation one must release the side deflection which is necessary in turning, but not recommended in grooving.

The following machining sequence is suggested:

After completing the longitudinal turning, but before starting the grooving, the side deflection must be released. Move the tool in the direction opposite that of feed, approximately .004", and return to the original position without side load.

Then, after the deflection has been released and the holder is perpendicular to the workpiece, the grooving operation may start.

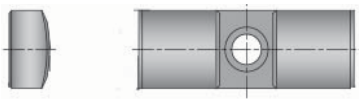
For MCTR Drills



- Guide pads are subject to wear, like inserts
- Each guide pad has 2 corners
- When the width of wear on the 1st corner reaches 70% of the width of the guide pad, reverse the guide pad and use the 2nd corner
- Replace the guide pad with a new one when the 2nd corner shows the same wear as the 1st corner
- Grade F2122 is the first recommendation, suitable for various workpiece materials, long tool life due to unique substrate and coating
- Grade F1122 is for high wear resistance

The American Standards Association has adopted a uniform system of wheel markings for easy identification of the elements which have been built into a grinding wheel. Each marking consists of six parts in the following sequence.

1. Abrasive Type & Manufacturer's Prefix
2. Grit Size
3. Grade of Hardness
4. Structure
5. Bond Type
6. Manufacturer's Specific Bond

AZ Surface Grinding Wheels (cont.)

- Made of premium blue bond aluminum oxide, ideal for grinding high speed steels over 55RC
- Features exceptionally fast and cool cutting characteristic suitable for grinding heat sensitive, heat alloy steels and mold steels. Can also be used on general tool steels
- The bond is designed to cut freely while pulling the heat away from the part and into the matrix of the wheel
- Requires minimum dressing and holds form well
- Great for 32A grinding wheel applications. Recommended 1 grade harder.

Grease Sticks

For Coated Abrasive Belts and Discs

MJ61F26 All Purpose Lubricant for Belts & Discs - A lightbodied grease — that spreads out thinly —remains "wet" on the belt — and provides lubrication by penetrating the coated abrasive surface. Prevents clogging and leaves the abrasive grit free to cut clean and smooth. Recommended for all belt polishing operations — on all metals, plastic and glass

MJ61F90 White Tallow Base Lubricant with High Melting Point - Serves as a lubricant and, at the same time, fills and closes the belt with a heavy bodied grease film. When applied to fine grit size coated abrasive belts it permits a glazing or burnishing action. When applied to coarse grit belt operations the grease film is heavy enough to stay on the belt under severe conditions

MJ61F122 Mixture of Belt Grease & Aluminum Oxide Buffing Flour - Recommended for Belt Polishing Operations on Stainless and Carbon Steel. A mixture of belt grease and unfused, aluminum oxide buffing flour. The grease base serves as a lubricant, and the abrasive flour functions the same as a buffing compound "Coloring Agent" to impart luster to the polished work. Particularly recommended for belt polishing operations on stainless or carbon steel when a high quality, bright finish is desirable

MJ61F115 Mixture of Belt Grease & Tripoli Abrasive - Recommended for Belt Polishing Operations on Non-Ferrous Metals. Coated abrasive belts, used for polishing such non-ferrous metals as zinc or aluminum die casting are too often discarded long before their useful life is expended simply because they become loaded with metal particles. The Tripoli abrasive blended with the grease base of Order. No. MJ65-F115 serves to fill between the abrasive grains on the belt, and minimizes this metal loading condition. In addition, the Tripoli abrasive itself functions as a buffing compound "coloring agent" in bringing out a brighter luster than is obtainable with a straight grease lubricant

MJ61F200 Wheel Wax - A new crystalline wax formulation combined with a unique, dry, inorganic, lubricating additive. Permits super-fine grinding, polishing and finishing

The Flex-Hone tool is a low RPM tool. Specific RPM is dependent on the diameter of the tool and the application. General speed ranges are given but, again, machine trials are required to verify the parameters. Hone Dia. RPM

19“ to 36“ 60-120 RPM
12“ to 18“ 80 to 350 RPM
8“ to 12“ 300 to 500 RPM
4“ to 8“ 400 to 600 RPM
2“ to 4“ 600 to 800 RPM
1/2“ to 2“ 700 to 900 RPM
4mm to 1/2“ 800-1200 RPM

Remember:
The Smaller the hone, the faster the speed.
The larger the hone, the slower the speed
